Internship certificate - Proof of practical work experience

Dear Ladies and Gentlemen,

We hereby confirm that Mr. Youssef Elbehiry, born on 20/09/1999 in Dakahliya, has completed an industrial internship in our company from 10/06/2025 to 04/09/2025, thus on 63 days/13 weeks. The internship took place at Cairo West Power Station.

The weekly workload averaged 37.5 hours. During the above training period, no vacation days were granted to Mr. Elbehiry. No days were missed.

Mr. Elbehiry's training focused on: measuring, testing and quality control, assembly, maintenance and repair, research and development, design and testing, as well as production planning and control.

Specifically, the following was taught or performed:

- Comprehensive safety induction including personal protective equipment handling and electrical safety protocols.
- Precision measurement using vernier calipers, micrometers, dial indicators, and height gauges.
- Quality inspection procedures for incoming components and manufactured parts.
- Disassembly and assembly techniques for centrifugal pump systems.
- Maintenance procedures for boiler feed pumps and cooling water circulation equipment.
- Bearing installation methods including thermal fitting and clearance verification.
- Mechanical seal assembly and shaft alignment procedures.
- Heat exchanger tube inspection, removal, and installation through rolling techniques.
- Vibration analysis for predictive maintenance and fault detection.
- Lubrication oil system servicing and filter replacement.
- Gas-insulated switchgear installation procedures and leak testing methods.
- Circuit breaker commissioning and timing verification tests.

- Work order preparation and preventive maintenance scheduling.
- Performance testing of pumps and rotating equipment.

Project tasks:

- i. Performed dimensional inspections on critical pump components using precision measuring instruments including vernier calipers and micrometers to verify manufacturing tolerances.
- ii. Participated in complete overhaul of multi-stage centrifugal boiler feed pump including systematic disassembly, wear inspection, and component replacement following maintenance procedures.
- iii. Installed new angular contact bearings using induction heating method and verified proper preload ensuring optimal bearing performance and longevity.
- iv. Conducted vibration analysis on rotating equipment using frequency spectrum techniques, successfully identifying bearing outer race defect at calculated fault frequency of.
- v. Assembled pump stages maintaining critical clearances and performed precision shaft alignment.
- vi. Prepared detailed work orders and preventive maintenance schedules using CMMS system, including equipment hierarchy, labor estimates, required parts, and safety permit requirements.
- vii. Executed performance testing of overhauled pump measuring flow rate, pressures, and calculating overall efficiency confirming successful restoration to design specifications.

During his internship, Mr. Elbehiry showed strong interest and dedication in his work. He learned quickly and handled technical tasks with care and attention to detail. His colleagues and supervisors valued his positive attitude, teamwork, and professional behavior.

We appreciate Mr. Elbehiry for his collaborative attitude and extend our best wishes for his future endeavors both personally and professionally.

Best regards,

Mahmoud Salama

HR-Business Partner
